https://www.ucdavis.edu/about/visit/campus-virtual-tour

The UC Davis virtual tour website appears to have a good interface design and user experience. The navigation menu is clear and organized, the layout is visually appealing, and interactive elements such as 360-degree panoramic views are included. The content is informative and provides value to the user. However, there may be other aspects of the website that could be improved. Possible areas for improvement of the UC Davis virtual tour website include faster loading speed, improved accessibility features, better mobile optimization, and enhanced interactivity.

The San Jose Scavenger Hunt website by Let's Roam has a visually appealing and responsive interface design that adapts well to different screen sizes. The interaction design is engaging and interactive, providing users with a fun and immersive scavenger hunt experience. Overall, the user experience is well-crafted, with clear instructions and helpful hints provided throughout the hunt. However, some users have reported technical difficulties with the website's GPS tracking feature, which could be improved to ensure a smoother user experience. Additionally, the website could benefit from more detailed information about the city and its landmarks to enhance the user's knowledge and understanding of the area.
